

## **Lab Exercise 13- Managing Namespaces in Kubernetes**

### **Step 1: Understand Namespaces**

Namespaces provide a mechanism for scoping resources in a cluster. Namespaces can be used to:

- Create environments for different applications or teams.
- Apply policies like resource quotas or network policies on a per-namespace basis.
- Separate operational environments (like development and production).

### **Step 2: List Existing Namespaces**

To list all the namespaces in your Kubernetes cluster:

```
kubectl get namespaces
```

```
C:\Users\prati>kubectl get namespaces
NAME                STATUS    AGE
default             Active    11d
kube-node-lease     Active    11d
kube-public         Active    11d
kube-system         Active    11d
kubernetes-dashboard Active    12m
```

You will typically see default namespaces like default, kube-system, and kube-public.

### Step 3: Create a Namespace

You can create a namespace using a YAML file or directly with the kubectl command.

#### Using YAML File

Create a file named my-namespace.yaml with the following content:

```
apiVersion: v1
kind: Namespace
metadata:
  name: my-namespace
```

Apply this YAML to create the namespace:

```
kubectl apply -f my-namespace.yaml
```

```
C:\Users\prati>kubectl apply -f my-namespace.yaml
namespace/my-namespace created
```

Using kubectl Command

Alternatively, create a namespace using the kubectl command:

```
kubectl create namespace my-namespace
```

```
C:\Users\prati>kubectl create namespace my-namespace  
Error from server (AlreadyExists): namespaces "my-namespace" already exists
```

Verify that the namespace is created:

```
kubectl get namespaces
```

```
C:\Users\prati>kubectl get namespaces  
NAME                STATUS    AGE  
default             Active    11d  
kube-node-lease     Active    11d  
kube-public         Active    11d  
kube-system         Active    11d  
kubernetes-dashboard Active    15m  
my-namespace        Active    20s
```

You should see my-namespace listed in the output.

#### **Step 4: Deploy Resources in a Namespace**

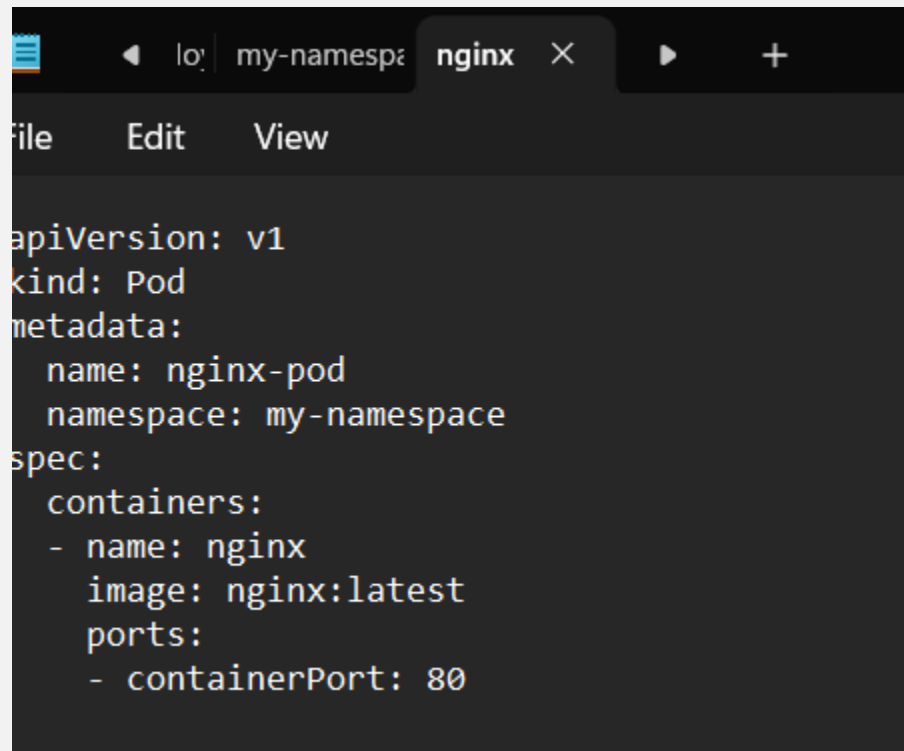

Create resources such as Pods, Services, or Deployments within the new namespace.

Deploy a Pod in the Namespace

Create a YAML file named nginx-pod.yaml with the following content:

```
apiVersion: v1  
kind: Pod  
metadata:
```

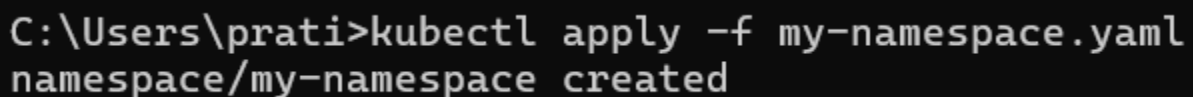

```
name: nginx-pod
namespace: my-namespace
spec:
  containers:
  - name: nginx
    image: nginx:latest
    ports:
    - containerPort: 80
```

A screenshot of a code editor window. The title bar shows a file named 'nginx' in a folder named 'my-namespace'. The editor has a menu bar with 'File', 'Edit', and 'View'. The code content is a Kubernetes Pod manifest in YAML format, identical to the one shown in the first block. The background is dark, and the text is light gray.

```
apiVersion: v1
kind: Pod
metadata:
  name: nginx-pod
  namespace: my-namespace
spec:
  containers:
  - name: nginx
    image: nginx:latest
    ports:
    - containerPort: 80
```

Apply this YAML to create the Pod:

```
kubectl apply -f nginx-pod.yaml
```

A screenshot of a terminal window. The prompt is 'C:\Users\prati>'. The command entered is 'kubectl apply -f my-namespace.yaml'. The output is 'namespace/my-namespace created'.

```
C:\Users\prati>kubectl apply -f my-namespace.yaml
namespace/my-namespace created
```

Check the status of the Pod within the namespace:

```
kubectl get pods -n my-namespace
```

```
C:\Users\prati>kubectl get pods -n my-namespace
NAME          READY   STATUS    RESTARTS   AGE
nginx-pod     1/1     Running   0           10s
```

To describe the Pod and see detailed information:

```
kubectl describe pod nginx-pod -n my-namespace
```

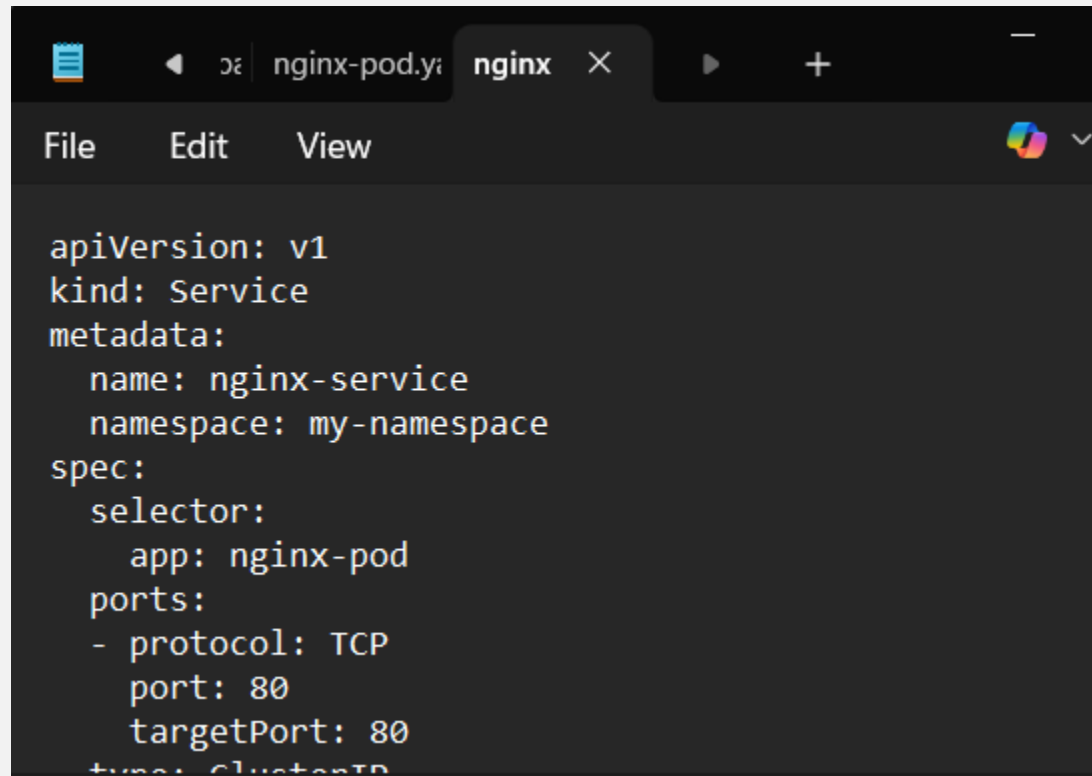

```
C:\Users\prati>kubectl describe pod nginx-pod -n my-namespace
Name:          nginx-pod
Namespace:     my-namespace
Priority:       0
Service Account: default
Node:          docker-desktop/192.168.65.3
Start Time:    Sun, 22 Feb 2026 00:07:42 +0530
Labels:        <none>
Annotations:   <none>
Status:        Running
IP:            10.1.0.77
IPs:           <none>
```

Create a Service in the Namespace

Create a YAML file named **nginx-service.yaml** with the following content:

```
apiVersion: v1
kind: Service
metadata:
  name: nginx-service
  namespace: my-namespace
spec:
  selector:
    app: nginx-pod
  ports:
    - protocol: TCP
```

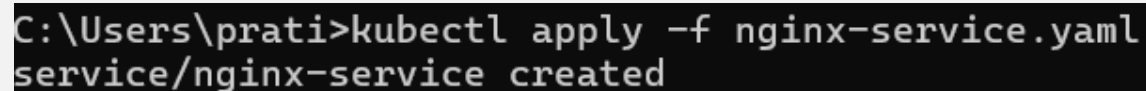

port: 80  
targetPort: 80  
type: ClusterIP

```
apiVersion: v1
kind: Service
metadata:
  name: nginx-service
  namespace: my-namespace
spec:
  selector:
    app: nginx-pod
  ports:
    - protocol: TCP
      port: 80
      targetPort: 80
  type: ClusterIP
```

Apply this YAML to create the Service:

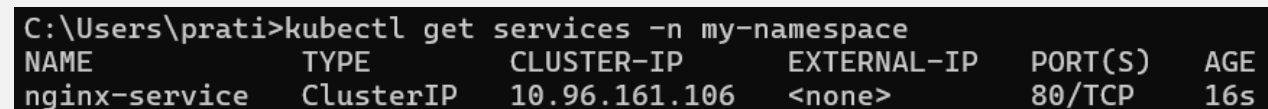

```
kubectl apply -f nginx-service.yaml
```

```
C:\Users\prati>kubectl apply -f nginx-service.yaml
service/nginx-service created
```

Check the status of the Service within the namespace:

```
kubectl get services -n my-namespace
```

```
C:\Users\prati>kubectl get services -n my-namespace
NAME          TYPE        CLUSTER-IP    EXTERNAL-IP  PORT(S)    AGE
nginx-service ClusterIP   10.96.161.106 <none>       80/TCP     16s
```

To describe the Service and see detailed information:

```
kubectl describe service nginx-service -n my-namespace
```

```
C:\Users\prati>kubectl describe service nginx-service -n my-namespace
Name:                nginx-service
Namespace:           my-namespace
Labels:              <none>
Annotations:         <none>
Selector:            app=nginx-pod
Type:               ClusterIP
IP Family Policy:    SingleStack
IP Families:         IPv4
IP:                 10.96.161.106
IPs:                10.96.161.106
Port:               <unset> 80/TCP
TargetPort:         80/TCP
Endpoints:
Session Affinity:    None
Internal Traffic Policy: Cluster
Events:             <none>
```

## Step 5: Switching Context Between Namespaces

When working with multiple namespaces, you can specify the namespace in kubectl commands or switch the default context.

### Specify Namespace in Commands

You can specify the namespace directly in kubectl commands using the `-n` or `--namespace` flag:

```
kubectl get pods -n my-namespace
```

```
C:\Users\prati>kubectl get pods -n my-namespace
NAME          READY   STATUS    RESTARTS   AGE
nginx-pod     1/1     Running   0          117s
```

### Set Default Namespace for kubectl Commands

To avoid specifying the namespace every time, you can set the default namespace for the current context:

```
kubectl config set-context --current --namespace=my-namespace
```

```
C:\Users\prati>kubectl config set-context --current --namespace=my-namespace  
Context "docker-desktop" modified.
```

Verify the current context's namespace:

```
kubectl config view --minify | grep namespace
```

```
C:\Users\prati>kubectl config view --minify | findstr namespace  
namespace: my-namespace
```

## Step 6: Clean Up Resources

To delete the resources and the namespace you created:

```
kubectl delete -f nginx-pod.yaml
```

```
kubectl delete -f nginx-service.yaml
```

```
kubectl delete namespace my-namespace
```

```
C:\Users\prati>kubectl delete -f nginx-pod.yaml  
pod "nginx-pod" deleted from my-namespace namespace  
  
C:\Users\prati>kubectl delete -f nginx-service.yaml  
service "nginx-service" deleted from my-namespace namespace  
  
C:\Users\prati>kubectl delete namespace my-namespace  
namespace "my-namespace" deleted
```

Ensure that the namespace and all its resources are deleted:

```
kubectl get namespaces
```

```
C:\Users\prati>kubect1 get namespaces
NAME                STATUS    AGE
default             Active    11d
kube-node-lease      Active    11d
kube-public          Active    11d
kube-system          Active    11d
kubernetes-dashboard Active    20m
```
