

Lab Exercise 8- Create POD in Kubernetes

Objective:

- Understand the basic structure and syntax of a Kubernetes Pod definition file (YAML).
- Learn to create, inspect, and delete a Pod in a Kubernetes cluster.

Prerequisites

- Kubernetes Cluster: You need a running Kubernetes cluster. You can set up a local cluster using tools like Minikube or kind, or use a cloud-based Kubernetes service.
- kubectl: Install and configure kubectl to interact with your Kubernetes cluster.
- Basic Knowledge of YAML: Familiarity with YAML format will be helpful as Kubernetes resource definitions are written in YAML.

Step-by-Step Guide

Step 1: Create a YAML File for the Pod

We'll create a Pod configuration file named **pod-example.yaml**

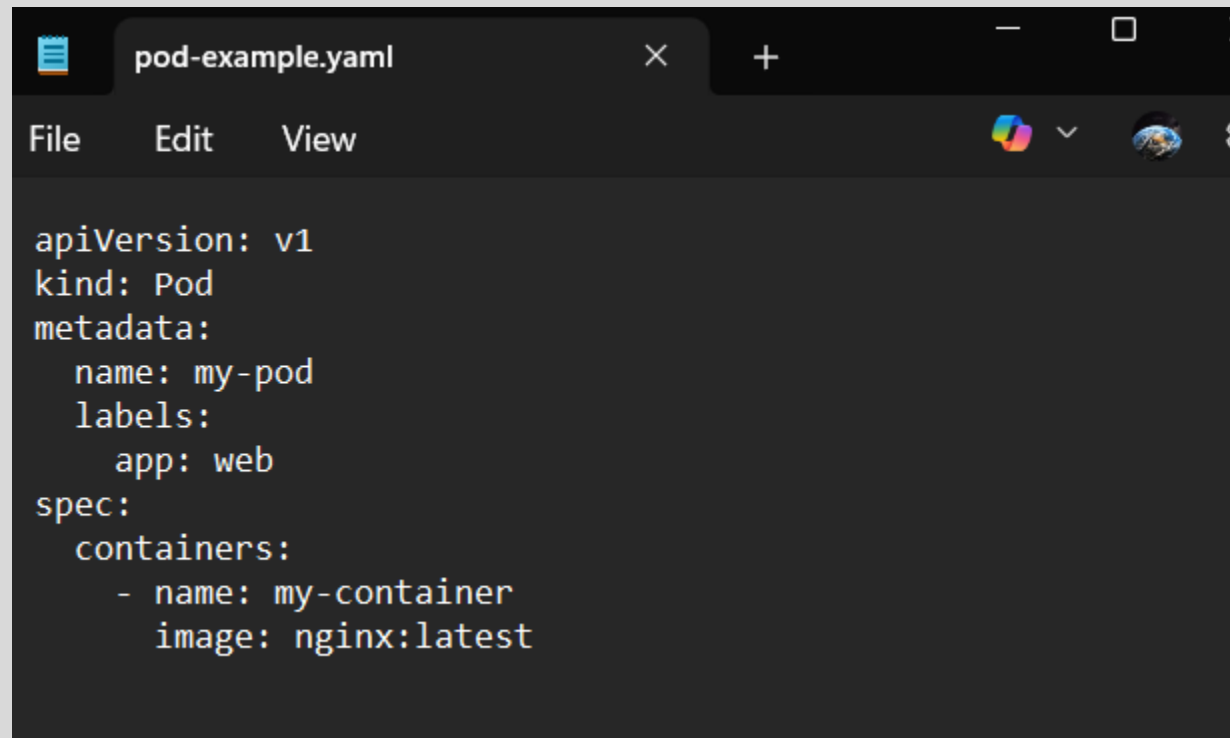

```
apiVersion: v1
kind: Pod
metadata:
  name: my-pod
labels:
  app: web
```

```
spec:
```

```
  containers:
```

```
    - name: my-container
```

```
      image: nginx:latest
```

```
apiVersion: v1
kind: Pod
metadata:
  name: my-pod
  labels:
    app: web
spec:
  containers:
    - name: my-container
      image: nginx:latest
```

Explanation of the YAML File

- **apiVersion:** Specifies the version of the Kubernetes API to use. For Pods, it's typically v1.
- **kind:** The type of object being created. Here it's a Pod.
- **metadata:** Provides metadata about the object, including name and labels. The name must be unique within the namespace, and labels help in identifying and organizing Pods.
- **spec:** Contains the specifications of the Pod, including:
 - **containers:** Lists all containers that will run inside the Pod. Each container needs:
 - **name:** A unique name within the Pod.

- image: The Docker image to use for the container.
- ports: The ports that this container exposes.
- env: Environment variables passed to the container.

Step 2: Apply the YAML File to Create the Pod

Use the `kubectl apply` command to create the Pod based on the YAML configuration file.

```
kubectl apply -f pod-example.yaml
```

```
C:\Users\prati\pod-example>kubectl apply -f pod-example.yaml
pod/my-pod unchanged
```

This command tells Kubernetes to create a Pod as specified in the `pod-example.yaml` file.

Step 3: Verify the Pod Creation

To check the status of the Pod and ensure it's running, use:

```
kubectl get pods
```

```
C:\Users\prati\pod-example>kubectl get pods
NAME      READY   STATUS    RESTARTS   AGE
my-pod    1/1     Running   0           2m46s
```

This command lists all the Pods in the current namespace, showing their status, restart count, and other details.

You can get detailed information about the Pod using:

```
kubectl describe pod my-pod
```

```
C:\Users\prati\pod-example>kubectl describe pod my-pod
Name: my-pod
Namespace: default
Priority: 0
Service Account: default
Node: docker-desktop/192.168.65.3
Start Time: Sat, 21 Feb 2026 20:33:20 +0530
Labels: app=web
Annotations: <none>
Status: Running
IP: 10.1.0.26
IPs:
  IP: 10.1.0.26
Containers:
  my-container:
    Container ID: docker://bc03363e5687ca922cd8a92ca06a20c10ab49ea177411220a9671dab6802e7a8
    Image: nginx:latest
    Image ID: docker-pullable://nginx@sha256:341bf0f3ce6c5277d6002cf6e1fb0319fa4252add24ab6a0e262e0056d313208
    Port: <none>
    Host Port: <none>
    State: Running
      Started: Sat, 21 Feb 2026 20:33:23 +0530
    Ready: True
    Restart Count: 0
    Environment: <none>
    Mounts:
```

This command provides detailed information about the Pod, including its events, container specifications, and resource usage.

Step 4: Interact with the Pod

You can interact with the running Pod in various ways, such as accessing the logs or executing commands inside the container.

View Logs: To view the logs of the container in the Pod:

```
kubectl logs my-pod
```

```

C:\Users\prati\pod-example>kubectl logs my-pod
/docker-entrypoint.sh: /docker-entrypoint.d/ is not empty, will attempt to perform
configuration
/docker-entrypoint.sh: Looking for shell scripts in /docker-entrypoint.d/
/docker-entrypoint.sh: Launching /docker-entrypoint.d/10-listen-on-ipv6-by-default.
sh
10-listen-on-ipv6-by-default.sh: info: Getting the checksum of /etc/nginx/conf.d/de
fault.conf
10-listen-on-ipv6-by-default.sh: info: Enabled listen on IPv6 in /etc/nginx/conf.d/
default.conf
/docker-entrypoint.sh: Sourcing /docker-entrypoint.d/15-local-resolvers.envsh
/docker-entrypoint.sh: Launching /docker-entrypoint.d/20-envsubst-on-templates.sh
/docker-entrypoint.sh: Launching /docker-entrypoint.d/30-tune-worker-processes.sh
/docker-entrypoint.sh: Configuration complete; ready for start up
2026/02/21 15:03:23 [notice] 1#1: using the "epoll" event method

2026/02/21 15:03:23 [notice] 1#1: start worker process 37
2026/02/21 15:03:23 [notice] 1#1: start worker process 38
2026/02/21 15:03:23 [notice] 1#1: start worker process 39
2026/02/21 15:03:23 [notice] 1#1: start worker process 40
2026/02/21 15:03:23 [notice] 1#1: start worker process 41
2026/02/21 15:03:23 [notice] 1#1: start worker process 42
2026/02/21 15:03:23 [notice] 1#1: start worker process 43
2026/02/21 15:03:23 [notice] 1#1: start worker process 44

```

Execute a Command: To run a command inside the container:

```
kubectl exec -it my-pod -- /bin/bash
```

```

C:\Users\prati\pod-example>kubectl exec -it my-pod -- /bin/bash
root@my-pod:/# exit
exit

```

The -it flag opens an interactive terminal session inside the container, allowing you to run commands.

Step 5: Delete the Pod

To clean up and remove the Pod when you're done, use the following command:

```
kubectl delete pod my-pod
```

```
C:\Users\prati\pod-example>kubectl delete pod my-pod  
pod "my-pod" deleted from default namespace
```

This command deletes the specified Pod from the cluster.
