

## Lab Exercise 5- Understanding CMD, RUN, and ENTRYPOINT in Dockerfile

### Objective:

To learn the differences between CMD, RUN, and ENTRYPOINT instructions in Dockerfiles by creating and running Docker containers with different configurations.

### Prerequisites:

- Docker installed on your machine
- Basic understanding of Docker and Dockerfile

### Part 1: Overview of CMD, RUN, and ENTRYPOINT

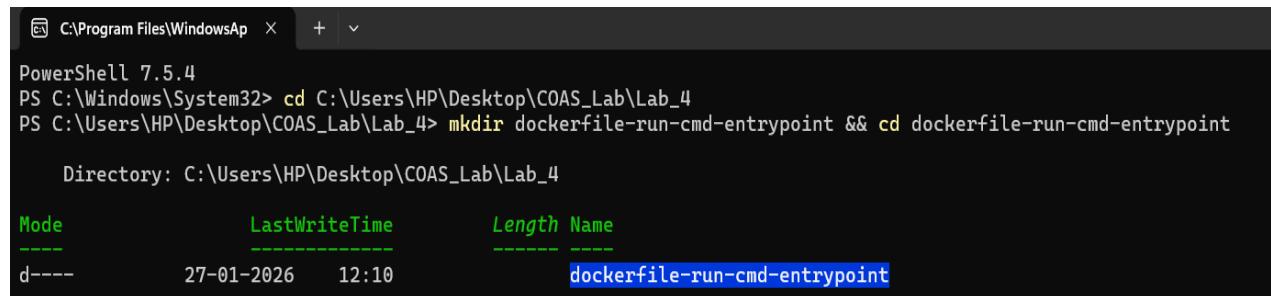

- **RUN:** Executes commands at build time to install software, download dependencies, or configure the environment. The result is saved in the image.
- **CMD:** Specifies the default command to be executed when a container starts. It can be overridden when running a container.
- **ENTRYPOINT:** Defines the main executable for the container, which can't be easily overridden. However, additional arguments can be passed when the container starts.

## Part 2: Exploring RUN Command

### 1. Create a Dockerfile with RUN:

Create a directory called dockerfile-run-cmd-entrypoint and navigate to it:

```
mkdir dockerfile-run-cmd-entrypoint && cd dockerfile-run-cmd-entrypoint
```

The screenshot shows a PowerShell window titled 'C:\Program Files\WindowsAp'. The command 'cd C:\Users\HP\Desktop\COAS\_Lab\Lab\_4' is run, followed by 'mkdir dockerfile-run-cmd-entrypoint && cd dockerfile-run-cmd-entrypoint'. The file listing below shows a single file named 'dockerfile-run-cmd-entrypoint' with a mode of 'd---', last write time of '27-01-2026', and length of '12:10'.

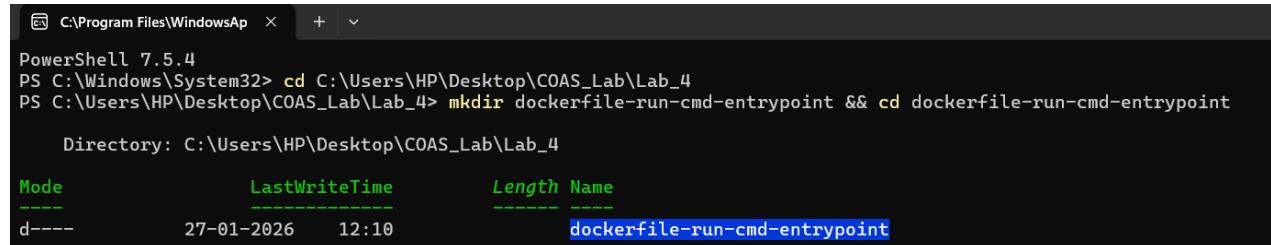

Mode	LastWriteTime	Length	Name
d---	27-01-2026	12:10	dockerfile-run-cmd-entrypoint

Create a simple Dockerfile that uses the RUN instruction:

```
# Use an official Ubuntu base image
FROM ubuntu:20.04

# Update the package repository and install curl
RUN apt-get update && apt-get install -y curl

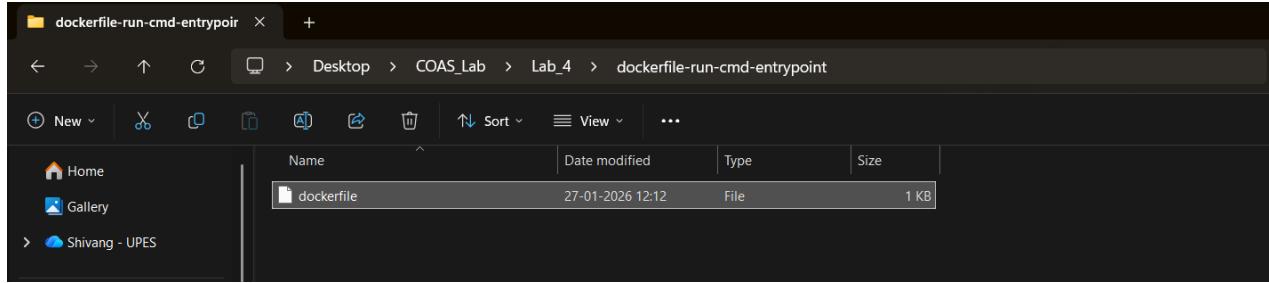

# Print the version of curl
RUN curl --version
```

The screenshot shows a PowerShell window titled 'C:\Program Files\WindowsAp'. The command 'cd C:\Users\HP\Desktop\COAS\_Lab\Lab\_4' is run, followed by 'mkdir dockerfile-run-cmd-entrypoint && cd dockerfile-run-cmd-entrypoint'. The file listing below shows a single file named 'dockerfile-run-cmd-entrypoint' with a mode of 'd---', last write time of '27-01-2026', and length of '12:10'.

Mode	LastWriteTime	Length	Name
d---	27-01-2026	12:10	dockerfile-run-cmd-entrypoint

```
PS C:\Users\HP\Desktop\COAS_Lab\Lab_4\dockerfile-run-cmd-entrypoint> wsl
docker-desktop:/tmp/docker-desktop-root/run/desktop/mnt/host/c/Users/HP/Desktop/COAS_Lab/Lab_4/dockerfile-run-cmd-entrypoint# touch dockerfile
docker-desktop:/tmp/docker-desktop-root/run/desktop/mnt/host/c/Users/HP/Desktop/COAS_Lab/Lab_4/dockerfile-run-cmd-entrypoint# exit
```

```
C: > Users > HP > Desktop > COAS_Lab > Lab_4 > dockerfile-run-cmd-entrypoint > dockerfile
1 # Use an official Ubuntu base image
2 FROM ubuntu:20.04
3
4 # Update the package repository and install curl
5 RUN apt-get update && apt-get install -y curl
6
7 # Print the version of curl
8 RUN curl --version
9 |
```

## 2. Build the Docker Image:

Build the image using the Dockerfile:

```
docker build -t run-example .
```

```
PS C:\Users\HP\Desktop\COAS_Lab\Lab_4\dockerfile-run-cmd-entrypoint> docker build -t run-example .
[+] Building 224.6s (8/8) FINISHED

View build details: docker-desktop://dashboard/build/desktop-linux/desktop-linux/s63i0qwxm7acdgm5jpd8q8g3t
PS C:\Users\HP\Desktop\COAS_Lab\Lab_4\dockerfile-run-cmd-entrypoint> |
```

### 3. Explanation:

The RUN commands in this Dockerfile are executed during the image build process. The first RUN installs curl, and the second RUN command checks and prints the curl version. After the image is built, the commands executed by RUN are already baked into the image.

### 4. Verify with Docker History:

You can check the layers created by RUN using:

```
docker history run-example
```

Each RUN command creates a new layer in the image.

```
PS C:\Users\HP\Desktop\COAS_Lab\Lab_4\dockerfile-run-cmd-entrypoint> docker history run-example
IMAGE          CREATED             CREATED BY               SIZE    COMMENT

PS C:\Users\HP\Desktop\COAS_Lab\Lab_4\dockerfile-run-cmd-entrypoint> |
```

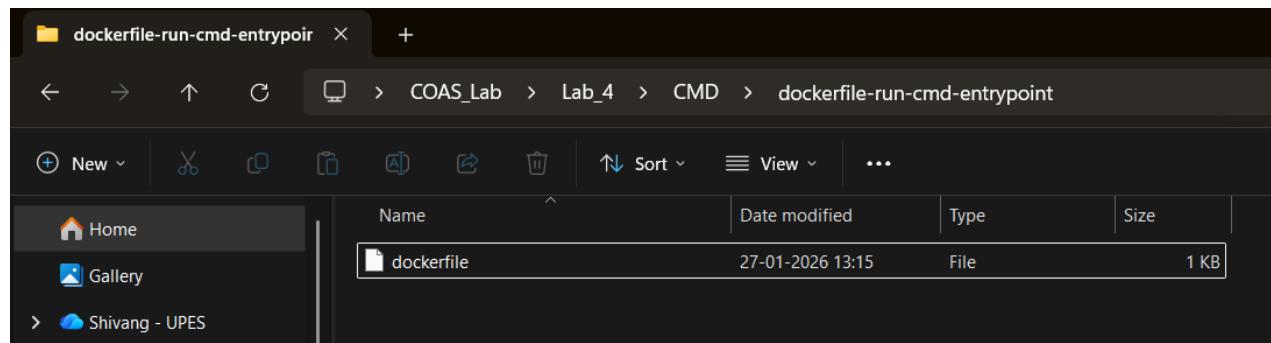

## Part 3: Exploring CMD Command

### 1. Create a Dockerfile with CMD:

Modify the Dockerfile to include the CMD instruction:

```
# Use an official Ubuntu base image
FROM ubuntu:20.04

# Install curl
RUN apt-get update && apt-get install -y curl
# Set default command to display the curl version
CMD ["curl", "--version"]
```

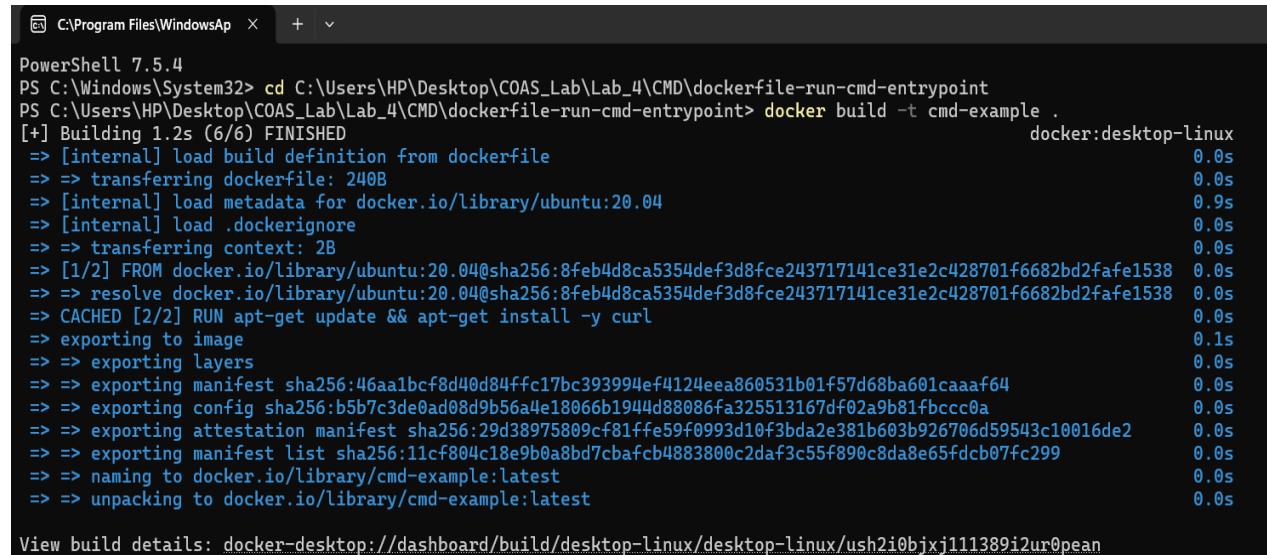

A screenshot of a code editor window titled 'dockerfile'. The code editor shows the Dockerfile content with syntax highlighting. The file path is C: > Users > HP > Desktop > COAS\_Lab > Lab\_4 > CMD > dockerfile-run-cmd-entrypoint > dockerfile. The code is:

```
1 # Use an official Ubuntu base image
2 FROM ubuntu:20.04
3
4 # Install curl
5 RUN apt-get update && apt-get install -y curl
6 # Set default command to display the curl version
7 CMD ["curl", "--version"]
```

## 2. Build the Docker Image:

Build the Docker image again:

```
docker build -t cmd-example .
```

```
PowerShell 7.5.4
PS C:\Program Files\Windows Ap × + ▾
PS C:\Windows\System32> cd C:\Users\HP\Desktop\COAS_Lab\Lab_4\CMD\dockerfile-run-cmd-entrypoint
PS C:\Users\HP\Desktop\COAS_Lab\Lab_4\CMD\dockerfile-run-cmd-entrypoint> docker build -t cmd-example .
[+] Building 1.2s (6/6) FINISHED

=> => exporting attestation manifest sha256:29d38975809cf81ffe59f0993d10f3bda2e381b603b926706d59543c10016de2
=> => exporting manifest list sha256:11cf804c18e9b0a8bd7cbafcb4883800c2daf3c55f890c8da8e65fdcb07fc299
=> => naming to docker.io/library/cmd-example:latest
=> => unpacking to docker.io/library/cmd-example:latest

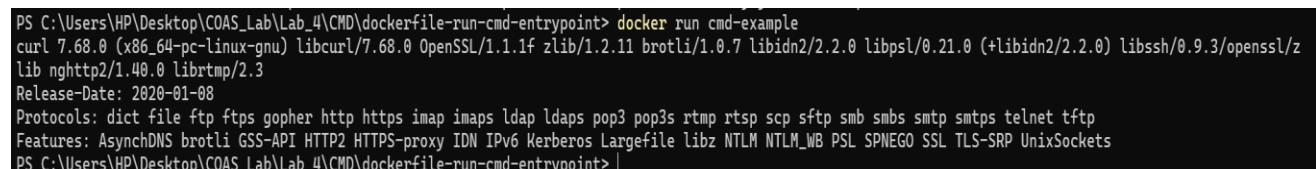

View build details: docker-desktop://dashboard/build/desktop-linux/desktop-linux/ush2i0bjxj111389i2ur0pean
```

## 3. Run the Container:

Run the container and see the output:

```
docker run cmd-example
```

The output will display the curl version as the default command defined by CMD is executed when the container starts.

```
PS C:\Users\HP\Desktop\COAS_Lab\Lab_4\CMD\dockerfile-run-cmd-entrypoint> docker run cmd-example
curl 7.68.0 (x86_64-pc-linux-gnu) libcurl/7.68.0 OpenSSL/1.1.1f zlib/1.2.11 brotli/1.0.7 libidn2/2.2.0 libpsl/0.21.0 (+libidn2/2.2.0) libssh/0.9.3/openssl/z
lib nghttp2/1.40.0 librtmp/2.3
Release-Date: 2020-01-08
Protocols: dict file ftp ftps gopher http https imap imaps ldap ldaps pop3 pop3s rtsp rtsp-svc scp sftp smb smbs smtp smtps telnet tftp
Features: AsynchDNS brotli GSS-API HTTP2 HTTPS-proxy IDN IPv6 Kerberos Largefile libz NTLM NTLM_WB PSL SPNEGO SSL TLS-SRP UnixSockets
PS C:\Users\HP\Desktop\COAS_Lab\Lab_4\CMD\dockerfile-run-cmd-entrypoint> |
```

#### 4. Override CMD:

You can override the CMD by specifying a different command when you run the container:

```
docker run cmd-example echo "Hello from CMD!"
```

This will print Hello from CMD!, showing that the CMD can be overridden at runtime.

```
PS C:\Users\HP\Desktop\COAS_Lab\Lab_4\CMD\dockerfile-run-cmd-entrypoint> docker run cmd-example echo "Hello from CMD!"  
Hello from CMD!  
PS C:\Users\HP\Desktop\COAS_Lab\Lab_4\CMD\dockerfile-run-cmd-entrypoint> |
```

## Part 4: Exploring ENTRYPOINT Command

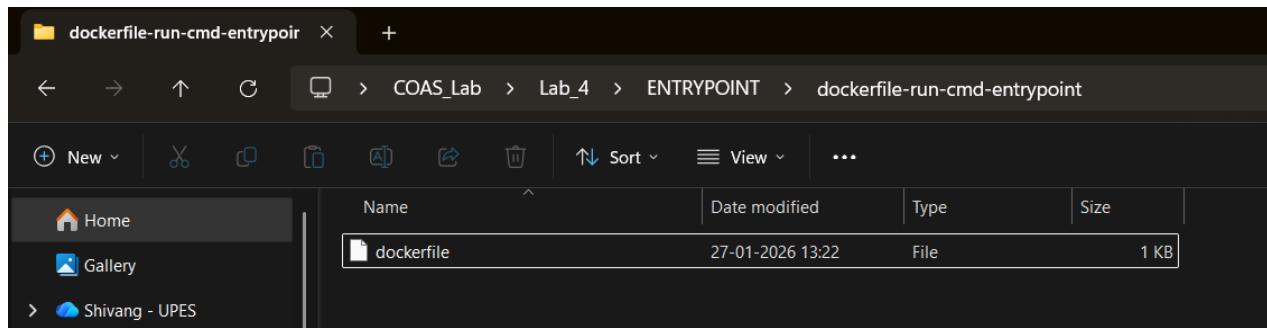

### 1. Create a Dockerfile with ENTRYPOINT:

Modify the Dockerfile to use ENTRYPOINT instead of CMD:

```
# Use an official Ubuntu base image
FROM ubuntu:20.04

# Install curl
RUN apt-get update && apt-get install -y curl

# Set entrypoint to curl command
ENTRYPOINT ["curl"]
```

```
C: > Users > HP > Desktop > COAS_Lab > Lab_4 > ENTRYPOINT > dockerfile-run-cmd-entrypoi > dockerfile
1 # Use an official Ubuntu base image
2 FROM ubuntu:20.04
3
4 # Install curl
5 RUN apt-get update && apt-get install -y curl
6
7 # Set entrypoint to curl command
8 ENTRYPOINT ["curl"]
9
10 # Default command to show help
```

## **2. Build the Docker Image:**

Build the image with the ENTRYPOINT instruction:

```
docker build -t entrypoint-example .
```

```
PowerShell 7.5.4
PS C:\Windows\System32> cd C:\Users\HP\Desktop\COAS_Lab\Lab_4\ENTRYPOINT\dockerfile-run-cmd-entrypoint
PS C:\Users\HP\Desktop\COAS_Lab\Lab_4\ENTRYPOINT\dockerfile-run-cmd-entrypoint> docker build -t entrypoint-example .
[+] Building 2.7s (7/7) FINISHED
    => [internal] load build definition from dockerfile

PS C:\Users\HP\Desktop\COAS_Lab\Lab_4\ENTRYPOINT\dockerfile-run-cmd-entrypoint> |
```

### **3. Run the Container:**

When you run the container, since ENTRYPOINT is set to curl, you need to provide arguments to the curl command:

```
docker run entrypoint-example --version
```

This will print the curl version because ENTRYPOINT defines the main executable (in this case, curl) and --version is passed as an argument to curl.

```
PS C:\Users\HP\Desktop\COAS_Lab\Lab_4\ENTRYPOINT\dockerfile-run-cmd-entrypoint> docker run entrypoint-example --version
curl/7.68.0 (x86_64-pc-linux-gnu) libcurl/7.68.0 OpenSSL/1.1.1f zlib/1.2.11 brotli/1.0.7 libidn2/2.2.0 libpsl/0.21.0 (+libidn2/2.2.0) libssh/0.9.3/openssl/z
libnghttp2/1.40.0 librtmp/2.3
Release-Date: 2020-01-08
Protocols: dict file ftp ftps gopher http https imap imaps ldap ldaps pop3 pop3s rtmp rtsp scp sftp smb smbs smtp smtps telnet tftp
Features: AsynchDNS brotli GSS-API HTTP2 HTTPS-proxy IDN IPv6 Kerberos Largefile libz NTLM NTLM_WB PSL SPNEGO SSL TLS-SRP UnixSockets
PS C:\Users\HP\Desktop\COAS_Lab\Lab_4\ENTRYPOINT\dockerfile-run-cmd-entrypoint> |
```

#### 4. Override ENTRYPPOINT:

Unlike CMD, the ENTRYPPOINT is not easily overridden. If you try to override it using:

```
docker run entrypoint-example echo "Hello from ENTRYPPOINT!"
```

It will result in an error because curl will interpret echo as an argument.

However, you can use the --entrypoint option to change the entrypoint:

```
docker run --entrypoint /bin/bash entrypoint-example -c "echo Hello from ENTRYPPOINT!"
```

This runs the container with /bin/bash as the entrypoint, overriding the default ENTRYPPOINT.

```
PS C:\Users\HP\Desktop\COAS_Lab\Lab_4\ENTRYPPOINT\dockerfile-run-cmd-entrypoint> docker run entrypoint-example echo "Hello from ENTRYPPOINT!"
% Total    % Received % Xferd  Average Speed   Time   Time     Time Current
          Dload  Upload Total Spent   Left Speed
0       0      0      0      0      0      0 --:--:-- 0:00:08 --:--:-- 0curl: (6) Could not resolve host: echo
curl: (3) URL using bad/illegal format or missing URL
PS C:\Users\HP\Desktop\COAS_Lab\Lab_4\ENTRYPPOINT\dockerfile-run-cmd-entrypoint> |
```

```
PS C:\Users\HP\Desktop\COAS_Lab\Lab_4\ENTRYPPOINT\dockerfile-run-cmd-entrypoint> docker run --entrypoint /bin/bash entrypoint-example -c "echo Hello from ENTRYPPOINT!"
Hello from ENTRYPPOINT!
PS C:\Users\HP\Desktop\COAS_Lab\Lab_4\ENTRYPPOINT\dockerfile-run-cmd-entrypoint> |
```

## Part 5: Combining CMD and ENTRYPOINT

### 1. Create a Dockerfile with Both CMD and ENTRYPOINT:

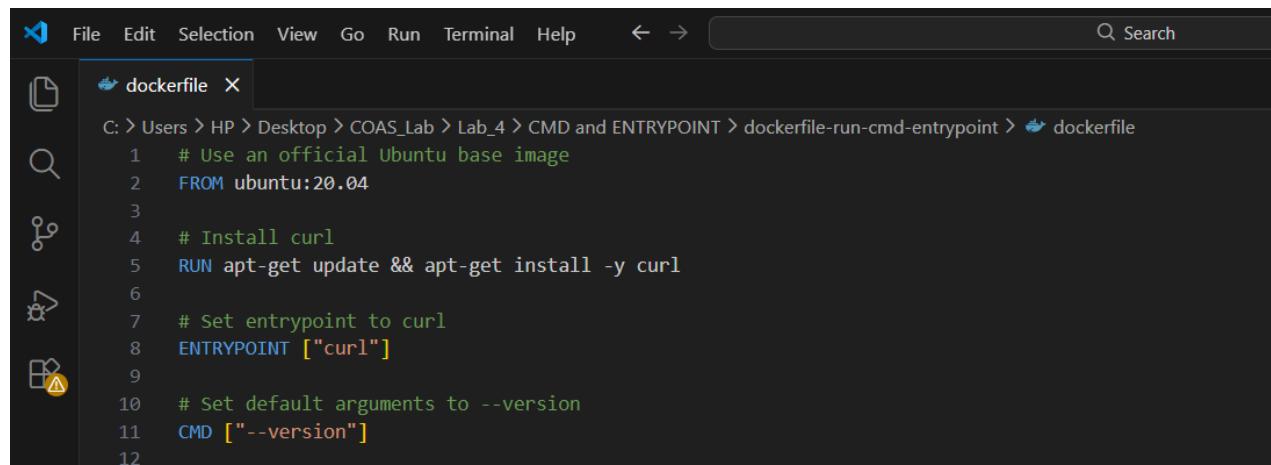

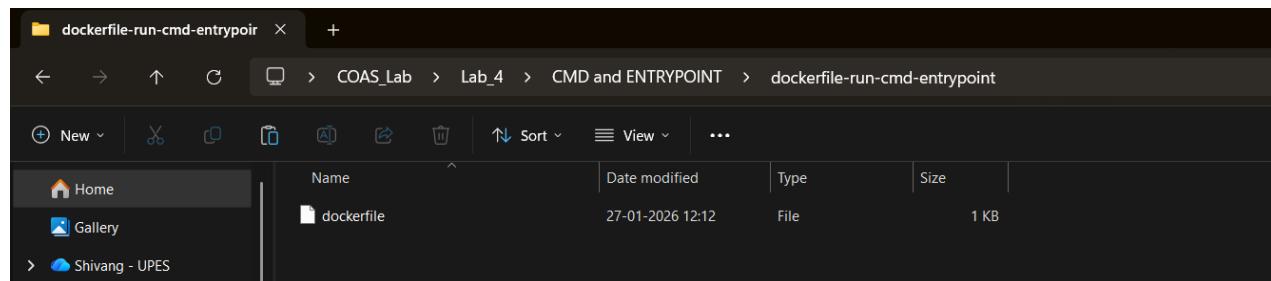

Modify the Dockerfile to use both CMD and ENTRYPOINT:

```
# Use an official Ubuntu base image
FROM ubuntu:20.04

# Install curl
RUN apt-get update && apt-get install -y curl

# Set entrypoint to curl
ENTRYPOINT ["curl"]

# Set default arguments to --version
CMD ["--version"]
```

## 2. Build the Image:

Build the new image:

```
docker build -t combined-example .
```

```
PS C:\Windows\System32> cd C:\Users\HP\Desktop\COAS_Lab\Lab_4\CMD_and_ENTRYPOINT\dockerfile-run-cmd-entrypoint
PS C:\Users\HP\Desktop\COAS_Lab\Lab_4\CMD_and_ENTRYPOINT\dockerfile-run-cmd-entrypoint> docker build -t combined-example .
[+] Building 2.6s (7/7) FINISHED
--> [internal] load build definition from dockerfile
--> => transferring dockerfile: 270B

--> => naming to docker.io/library/combined-example:latest
--> => unpacking to docker.io/library/combined-example:latest

View build details: docker-desktop://dashboard/build/desktop-linux/desktop-linux/ccied9t8t4x0v38rxe5mw6j7o
PS C:\Users\HP\Desktop\COAS_Lab\Lab_4\CMD_and_ENTRYPOINT\dockerfile-run-cmd-entrypoint> |
```

## 3. Run the Container:

When you run the container without specifying any arguments, it will use the CMD as arguments to ENTRYPOINT:

```
docker run combined-example
```

The output will show the curl version, as ENTRYPOINT is curl and CMD provides --version as the argument.

```
PS C:\Users\HP\Desktop\COAS_Lab\Lab_4\CMD_and_ENTRYPOINT\dockerfile-run-cmd-entrypoint> docker run combined-example
curl 7.68.0 (x86_64-pc-linux-gnu) libcurl/7.68.0 OpenSSL/1.1.1f zlib/1.2.11 brotli/1.0.7 libidn2/2.2.0 libpsl/0.21.0 (+libidn2/2.2.0) libssh/0.9.3/openssl/z
lib nghttp2/1.40.0 librtmp/2.3
Release-Date: 2020-01-08
Protocols: dict file ftp ftps gopher http https imap imaps ldap ldaps pop3 pop3s rtsp rtsp-sctp smb smbs smtp smtsp telnet tftp
Features: AsyncDNS brotli GSS-API HTTP2 HTTPS-proxy IDN IPv6 Kerberos Largefile libz NTLM NTLM_WB PSL SPNEGO SSL TLS-SRP UnixSockets
PS C:\Users\HP\Desktop\COAS_Lab\Lab_4\CMD_and_ENTRYPOINT\dockerfile-run-cmd-entrypoint> |
```

#### **4. Override CMD Arguments:**

You can override the CMD arguments by specifying your own arguments:

```
docker run combined-example https://www.google.com
```

This command will run curl https://www.google.com inside the container.

### **Summary of Differences:**

- **RUN:** Executes commands during the image build process and creates layers. It is used to install packages and configure the environment.
- **CMD:** Specifies the default command to run when the container starts. It can be overridden by passing a different command when running the container.
- **ENTRYPOINT:** Specifies the main command for the container. It is harder to override but allows passing arguments from the command line. When combined with CMD, CMD provides the default arguments for ENTRYPOINT.

### **Conclusion:**

This lab exercise demonstrates the fundamental differences between RUN, CMD, and ENTRYPOINT in Docker. Each command serves a different purpose, from image build-time configuration (RUN) to defining the container's behavior at runtime (CMD and ENTRYPOINT). Understanding these differences is crucial for building effective and flexible Docker images.
