Lab Exercise 8- Create POD in Kubernetes

Name – Vishal Pandey
500125280
B2 DevOps

Objective:

- Understand the basic structure and syntax of a Kubernetes Pod definition file (YAML).
- Learn to create, inspect, and delete a Pod in a Kubernetes cluster.

Prerequisites

- Kubernetes Cluster: You need a running Kubernetes cluster. You can set up a local cluster using tools like Minikube or kind, or use a cloud-based Kubernetes service.
- kubectl: Install and configure kubectl to interact with your Kubernetes cluster.
- Basic Knowledge of YAML: Familiarity with YAML format will be helpful as Kubernetes resource definitions are written in YAML.
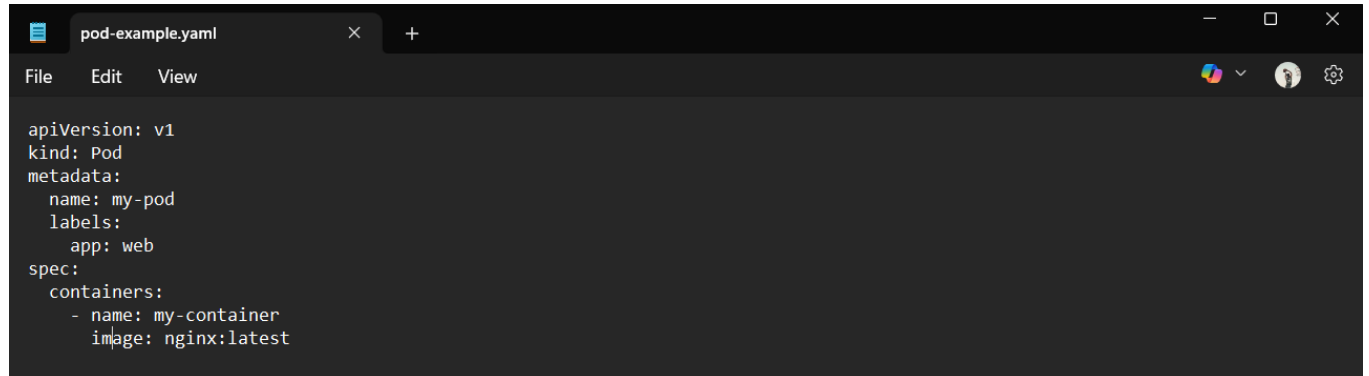

Step-by-Step Guide

Step 1: Create a YAML File for the Pod

We'll create a Pod configuration file named **pod-example.yaml**

```
apiVersion: v1
kind: Pod
metadata:
  name: my-pod
  labels:
    app: web
spec:
  containers:
```

```
    - name: my-container
     image: nginx:latest
```

```
☰  pod-example.yaml          ✕   +                                    —  □  ✕
File    Edit    View                                              ◆ ∨  👤  ⚙

apiVersion: v1
kind: Pod
metadata:
  name: my-pod
  labels:
    app: web
spec:
  containers:
    - name: my-container
      image: nginx:latest
```

Explanation of the YAML File

- apiVersion: Specifies the version of the Kubernetes API to use. For Pods, it's typically v1.

- kind: The type of object being created. Here it's a Pod.

- metadata: Provides metadata about the object, including name and labels. The name must be unique within the namespace, and labels help in identifying and organizing Pods.

- spec: Contains the specifications of the Pod, including:
  - containers: Lists all containers that will run inside the Pod. Each container needs:
    - name: A unique name within the Pod.
    - image: The Docker image to use for the container.
    - ports: The ports that this container exposes.
    - env: Environment variables passed to the container.

Step 2: Apply the YAML File to Create the Pod

Use the kubectl apply command to create the Pod based on the YAML configuration file.

```
kubectl apply -f pod-example.yaml
```

```
PS C:\Users\ASUS> cd Desktop
PS C:\Users\ASUS\Desktop> notepad pod-example.yaml
PS C:\Users\ASUS\Desktop> kubectl apply -f pod-example.yaml
pod/my-pod created
```

This command tells Kubernetes to create a Pod as specified in the pod-example.yaml file.

Step 3: Verify the Pod Creation

To check the status of the Pod and ensure it's running, use:

```
kubectl get pods
```

```
PS C:\Users\ASUS\Desktop> kubectl get pods
NAME        READY    STATUS      RESTARTS    AGE
my-pod      1/1      Running     0           2m42s
PS C:\Users\ASUS\Desktop> |
```

This command lists all the Pods in the current namespace, showing their status, restart count, and other details.

You can get detailed information about the Pod using:

```
kubectl describe pod my-pod
```

```
Windows PowerShell                    ×    +   ∨                      —    □    ✕

PS C:\Users\ASUS\Desktop> kubectl describe pod my-pod
Name:                  my-pod
Namespace:             default
Priority:              0
Service Account:       default
Node:                  minikube/192.168.49.2
Start Time:            Sun, 22 Feb 2026 12:54:38 +0530
Labels:                app=web
Annotations:           <none>
Status:                Running
IP:                    10.244.0.3
IPs:
  IP:  10.244.0.3
Containers:
  my-container:
    Container ID:   docker://8277789b7e0afcc3b02aa852077ba2fc7f7cfe25a4cc35c
c37327b130327e942
    Image:          nginx:latest
    Image ID:       docker-pullable://nginx@sha256:341bf0f3ce6c5277d6002cf6e
1fb0319fa4252add24ab6a0e262e0056d313208
    Port:           <none>
    Host Port:      <none>
    State:          Running
      Started:      Sun, 22 Feb 2026 12:54:50 +0530
    Ready:          True
    Restart Count:  0
    Environment:    <none>
    Mounts:
      /var/run/secrets/kubernetes.io/serviceaccount from kube-api-access-trk
84 (ro)
Conditions:
  Type                      Status
  PodReadyToStartContainers True
  Initialized               True
  Ready                     True
  ContainersReady           True
  PodScheduled              True
Volumes:
  kube-api-access-trk84:
    Type:                    Projected (a volume that contains injected data
 from multiple sources)
    TokenExpirationSeconds:  3607
    ConfigMapName:           kube-root-ca.crt
    Optional:                false
    DownwardAPI:             true
QoS Class:                   BestEffort
```

This command provides detailed information about the Pod, including its events, container specifications, and resource usage.

Step 4: Interact with the Pod

You can interact with the running Pod in various ways, such as accessing the logs or executing commands inside the container.

View Logs: To view the logs of the container in the Pod:

```
kubectl logs my-pod
```

```
PS C:\Users\ASUS\Desktop> kubectl logs my-pod
/docker-entrypoint.sh: /docker-entrypoint.d/ is not empty, will attempt to p
erform configuration
/docker-entrypoint.sh: Looking for shell scripts in /docker-entrypoint.d/
/docker-entrypoint.sh: Launching /docker-entrypoint.d/10-listen-on-ipv6-by-d

2026/02/22 07:24:50 [notice] 1#1: start worker process 31
2026/02/22 07:24:50 [notice] 1#1: start worker process 32
2026/02/22 07:24:50 [notice] 1#1: start worker process 33
2026/02/22 07:24:50 [notice] 1#1: start worker process 34
2026/02/22 07:24:50 [notice] 1#1: start worker process 35
2026/02/22 07:24:50 [notice] 1#1: start worker process 36
2026/02/22 07:24:50 [notice] 1#1: start worker process 37
2026/02/22 07:24:50 [notice] 1#1: start worker process 38
2026/02/22 07:24:50 [notice] 1#1: start worker process 39
2026/02/22 07:24:50 [notice] 1#1: start worker process 40
2026/02/22 07:24:50 [notice] 1#1: start worker process 41
2026/02/22 07:24:50 [notice] 1#1: start worker process 42
2026/02/22 07:24:50 [notice] 1#1: start worker process 43
2026/02/22 07:24:50 [notice] 1#1: start worker process 44
```

Execute a Command: To run a command inside the container:

kubectl exec -it my-pod -- /bin/bash

The -it flag opens an interactive terminal session inside the container, allowing you to run commands.

Step 5: Delete the Pod

To clean up and remove the Pod when you're done, use the following command:

kubectl delete pod my-pod

This command deletes the specified Pod from the cluster.

```
PS C:\Users\ASUS\Desktop> kubectl delete pod my-pod
pod "my-pod" deleted from default namespace
PS C:\Users\ASUS\Desktop>
```
